

## Some Important Points to Note about CHEM 102B

Homework on Assignments handout means Online Homework  
(Lon Capa)

**Homework 1 due Tuesday, Jan 25, 9a.m.**

Problems listed on Assignments handouts from text must be done because some of these problems will reappear on your quizzes.

Chemistry is **NOT** a spectator subject; the more problems you attempt; the better grade you will get!

Worksheets on course worksheet must be completed before attending the discussion so you can get assistance with any problems you do not understand at the discussion section. Some of the worksheet problems will also reappear on quizzes.

**ATOMS,  
MOLECULES  
AND  
IONS**

# Atoms

Atoms are the building blocks of matter.

Understanding the structure and properties of atoms is critical as combinations of atoms lead to the formation of unlimited number of chemical compounds, some of which are essential for life.

# Dalton's Atomic Theory

John Dalton

1. Matter is composed of indivisible atoms.
2. All atoms of a given chemical element have identical properties.
3. Different chemical elements are composed of different atoms of different masses.
4. Atoms are indestructible and chemical reactions are a rearrangement of atoms.
5. A compound forms from its elements through the combination of atoms of unlike elements in small whole number ratios.

# 1. Matter is composed of indivisible atoms

We now know that atoms have subatomic particles called electrons, neutrons and protons.

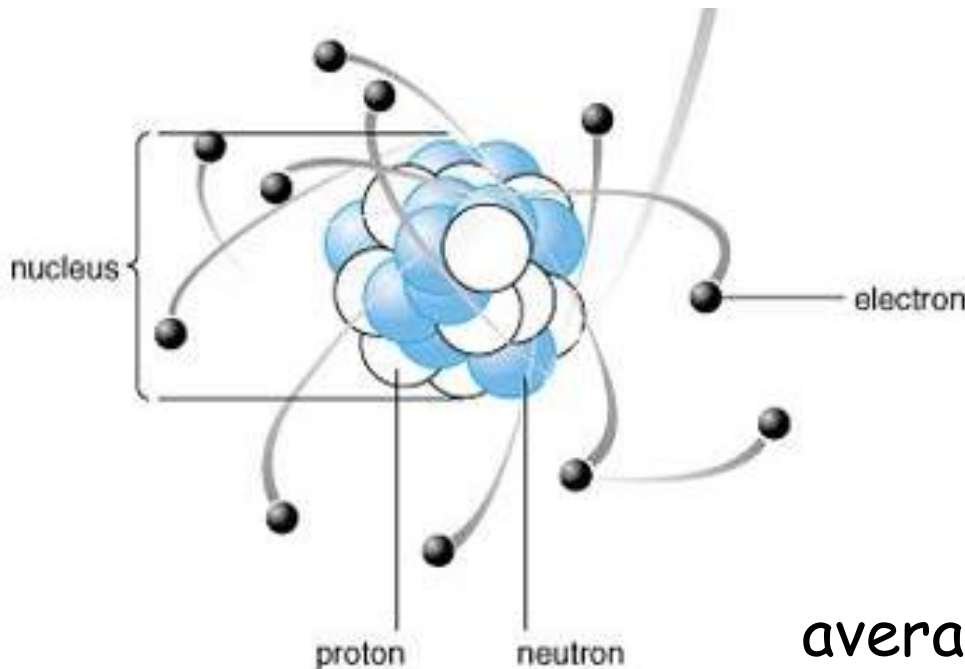

Particle	Symbol	Absolute Charge (C)	Relative Charge	Absolute mass (kg)
Electron	$e^-$	$-1.60 \times 10^{-19}$	-1	$9.11 \times 10^{-31}$
Proton	$p^+$	$1.60 \times 10^{-19}$	+1	$1.673 \times 10^{-27}$
Neutron	$n^0$	0	0	$1.675 \times 10^{-27}$

# 1. Matter is composed of indivisible atoms

The nucleus of an atom contains protons and neutrons.

The nucleus contains nearly all of the mass of the atom, but it occupies only a tiny fraction of the space inside the atom

Electrons move around the nucleus.

This electron "cloud" makes up the volume of the atom.

average diameter of atom =  $10^{-10}$  m

An atom is electrically neutral because # protons = # electrons

2. All atoms of a given element have identical properties ❌

Each **element** has a unique number of protons in its atoms.

This number of protons within the atom is called the **atomic number** (abbreviated **Z**).

All carbon (**C**) atoms contain 6 protons, **Z = 6**

A neutral carbon atom contains 6 electrons and 6 protons

There are atoms of the same element that differ in the number of neutrons they contain and **collectively** they are called **isotopes**, individually they are called **nuclides**.

2. All atoms of a given element have identical properties ❌

The mass number (abbreviated A) is the total number of protons and neutrons in the nucleus of an atom.

Mass number = Total number of protons + Total number of neutrons

Nuclide general symbol

Most abundant nuclide of carbon:  ${}^{12}_6\text{C}$  6 protons + 6 neutrons

Nuclide of carbon used in carbon-14 dating:  ${}^{14}_6\text{C}$  6 protons + 8 neutrons

Atoms with similar chemical properties are in the same **Group** of the

Periodic Table.      Vertical columns = Groups

Horizontal rows = periods

The Periodic Table has seven periods

## Group 8A /18

2	He
10	Ne
18	Ar
36	Kr
54	Xe
86	Rn

## Noble gases

unreactive

8 valence electrons (Except He 2 valence e<sup>-</sup>)

monatomic gases

## Alkali metals

## Group 1A /1

3	Li
11	Na
19	K
37	Rb
55	Cs
87	Fr

soft solids

**Very** reactive

1 valence electron      **lose** 1 electron when taking part in chemical reactions

19 protons      19 protons  
19 electrons      18 electrons

K<sup>+</sup> is a cation (positively charged ion)

## Group 2A / 2

4	Be
12	Mg
20	Ca
38	Sr
56	Ba
88	Ra

## Alkaline earth metals

Reactive solids

2 valence electrons

**lose** 2 electrons when taking part in chemical reactions

20 protons      20 protons

20 electrons    **18 electrons**

## Group 7A / 17

9	F
17	Cl
35	Br
53	I
85	At

## Halogens $X_2$

very reactive non-metals

7 valence electrons

**gain** 1 electron when taking part in chemical reactions

17 protons      17 protons

17 electrons    **18 electrons**

Anions are ions with negative charges

	3A	4A	5A	6A	7A
<b>B</b> 5	<b>C</b> 6	<b>N</b> 7	<b>O</b> 8	<b>F</b> 9	
	<b>Si</b> 14	<b>P</b> 15	<b>S</b> 16	<b>Cl</b> 17	
	<b>Ge</b> 32	<b>As</b> 33	<b>Se</b> 34	<b>Br</b> 35	
		<b>Sb</b> 51	<b>Te</b> 52	<b>I</b> 53	
				<b>At</b> 85	

Metalloids exhibit both metallic and nonmetallic properties

Metals : conduct heat, electricity  
solids (Hg is the exception)  
lose electrons

Non-metals: poor conductors  
solids, liquids, gases

# Hydrogen is an Anomaly

**H**<sup>1</sup> Can lose or gain an electron

1 proton      1 proton  
1 electron    0 electron

1 proton      1 proton  
1 electron    2 electrons

5. Compounds contain a definite and small number of atoms

Ionic solids metal + non-metal  
cation + anion

sodium + chlorine

magnesium + nitrogen

Statement 5 is not true in complex organic compounds like sugar  $\text{C}_{12}\text{H}_{22}\text{O}_{11}$ .

# Transition Metals

21 Sc	22 Ti	23 V	24 Cr	25 Mn	26 Fe	27 Co	28 Ni	29 Cu	30 Zn
39 Y	40 Zr	41 Nb	42 Mo	43 Tc	44 Ru	45 Rh	46 Pd	47 Ag	48 Cd
57 *La	72 Hf	73 Ta	74 W	75 Re	76 Os	77 Ir	78 Pt	79 Au	80 Hg
89 +Ac	104 Rf	105 Ha	106 Sg	107 Ns	108 Hs	109 Mt	110 110	111 111	112 112

These metals form **multiple ions** except  $\text{Ag}^+$

For example:

Ions of manganese :  $\text{Mn}^{2+}$ ,  $\text{Mn}^{3+}$ ,  $\text{Mn}^{4+}$

# How to Write and Name Ionic Compounds

An ionic compound consists of ions held together by attractive forces.

The **Criss Cross Method** enables the formula of compounds that contain ions to be determined.

## Steps of the Criss Cross Method

- i. Write the ions (with their charges) for your compound side by side, **starting with the cation.**
- ii. If either ion is a polyatomic ion, **place it in brackets.**
- iii. **Circle ONLY** the number of the charge of **both** ions.

## Steps of the Criss Cross Method (cont'd)

iv. Now write the formula of the compound that would be created if the numbers that you just "moved" were now **subscripts** of the corresponding ion.

If the number 1 was the number "moved", do not write this number as a subscript.

v. If the numbers moved are the same, **do not write them as part of your formula** as they will cancel each other out.

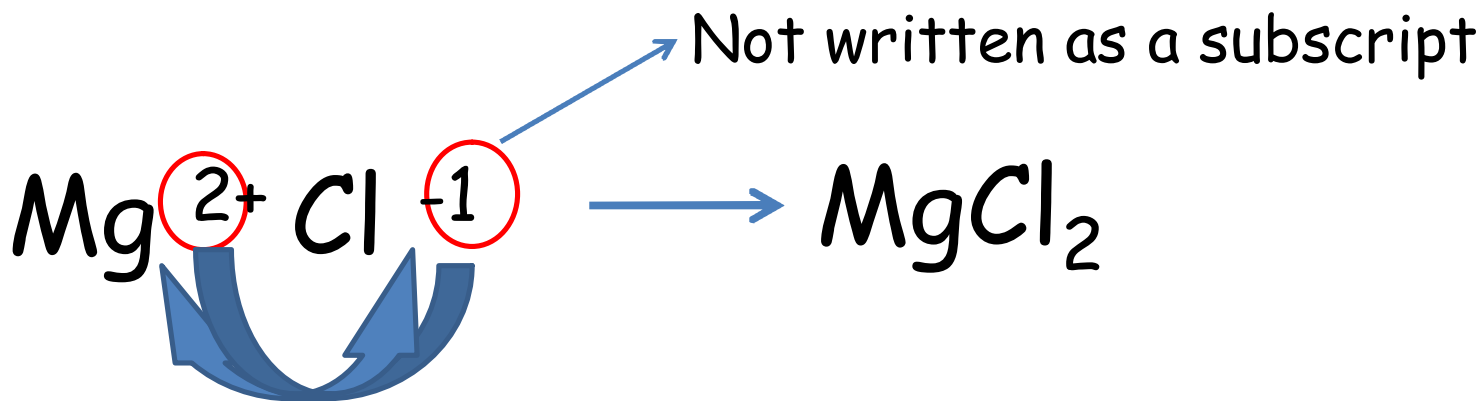

# What is the chemical formula of magnesium chloride ?

1. Identify the ions present:

magnesium cation:  $Mg^{2+}$

Chlorine anion:  $Cl^{-1}$

2. Using Criss Cross method:

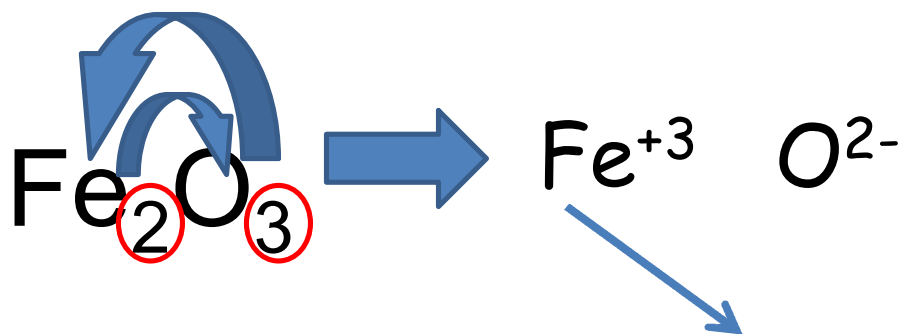

# What is the name of this ionic compound: $\text{Fe}_2\text{O}_3$ ?

1. Identify the ions present

Oxygen anion:  $\text{O}^{2-}$

iron cation: charge?

2. Reverse the Criss Cross method to obtain the charge of the cation

Metal with multiple cations

**Name: iron (III) oxide**

# Naming Covalent Compounds

Covalent compounds contain two **non-metals**.

The more non-metallic element is **written second** in the chemical formula.

**Order for writing the elements in a compound:**

**C, P, N, H, S, I, Br, Cl, O, F**

Hydrogen is in the centre so compounds containing H and these elements will be written as follows:

**CH<sub>4</sub>, PH<sub>3</sub>, NH<sub>3</sub>, H<sub>2</sub>S, HI, HBr, HCl, H<sub>2</sub>O, HF**

# Naming Covalent Compounds

The first part of the name of a molecular or covalent compound consists of the **entire name** of the first element in the formula of the compound.

Notice in the name of covalent molecules the **suffix -ide** is used in naming the **second element** in the molecular formula.

The number of each atom present is represented using a prefix

# List of Prefixes to be used

<b># of Atoms</b>	<b>Prefix</b>	<b># of Atoms</b>	<b>Prefix</b>
1	Mono-	6	Hexa-
2	di-	7	Hepta-
3	Tri-	8	Octa-
4	Tetra-	9	Nona-
5	Penta-	10	Deca-

# Examples of Naming Covalent Compounds

Molecular Formula	Name	Explanation
CO	carbon monoxide	Carbon is named first as it appears first in the formula. The word mono means one and there is only one oxygen atom in this molecule.
NO <sub>2</sub>	nitrogen dioxide	Nitrogen is named first as it appears first in the formula. There are two oxygen atoms and di- means two.
P <sub>4</sub> S <sub>3</sub>	tetraphosphorus trisulfide	There are four (tetra) phosphorus atoms and three (tri) sulfur atoms.

# Covalent compounds (anomalies)

$\text{NH}_3$  ~~nitrogen trihydride~~ ammonia

$\text{H}_2\text{O}$  ~~dihydrogen monoxide~~ water

Table 2.5 p.

62

$\text{NH}_4^+$  ammonium

$\text{OH}^-$  hydroxide

$\text{NO}_3^-$  nitrate

$\text{SO}_4^{2-}$  sulfate

$\text{PO}_4^{3-}$  phosphate

## Polyatomic ions

$\text{ClO}_3^-$  chlorate

$\text{MnO}_4^-$  permanganate

$\text{CrO}_4^{2-}$  chromate

$\text{CO}_3^{2-}$  carbonate

## Example of using the Criss-Cross Method

Write the formula of the neutral compound created from manganese  $2^+$  ions and nitrate ions and name the compound.

Step 4

**Name:** Manganese (II) nitrate
